

Skipping FBI warnings and other annoying previews with PgcEdit (version 0.4.3.1 for windows)

Last updated: 11/29/2004 by Jeanl.

Thanks to everybody in the forums for their help, to 2COOL for his guides that inspired this one, and r0lZ for coding PgcEdit!
If you're having problems with this guide, post [here](#) and you'll get some help!

If you're on a Mac, or with Linux, PgcEdit does not have any video or menu previewing. See [this version](#) of the guide.

Other [PgcEdit guides](#)...

Goal: Most commercial DVD begin playback with some annoying stuff: FBI warnings, previews, studio logos etc, and in some cases, it can take up to a minute to get to the main menu (and in some very annoying cases, you can't even skip all this with the remote because of PUOs (prohibited user operations) in the VOB files!). This guide will show you how to skip all this stuff and rapidly get to the first menu. It will also show you how to skip stuff that's *after* the menu, but before the movie playback (for example the THX bit, or more studio stuff).

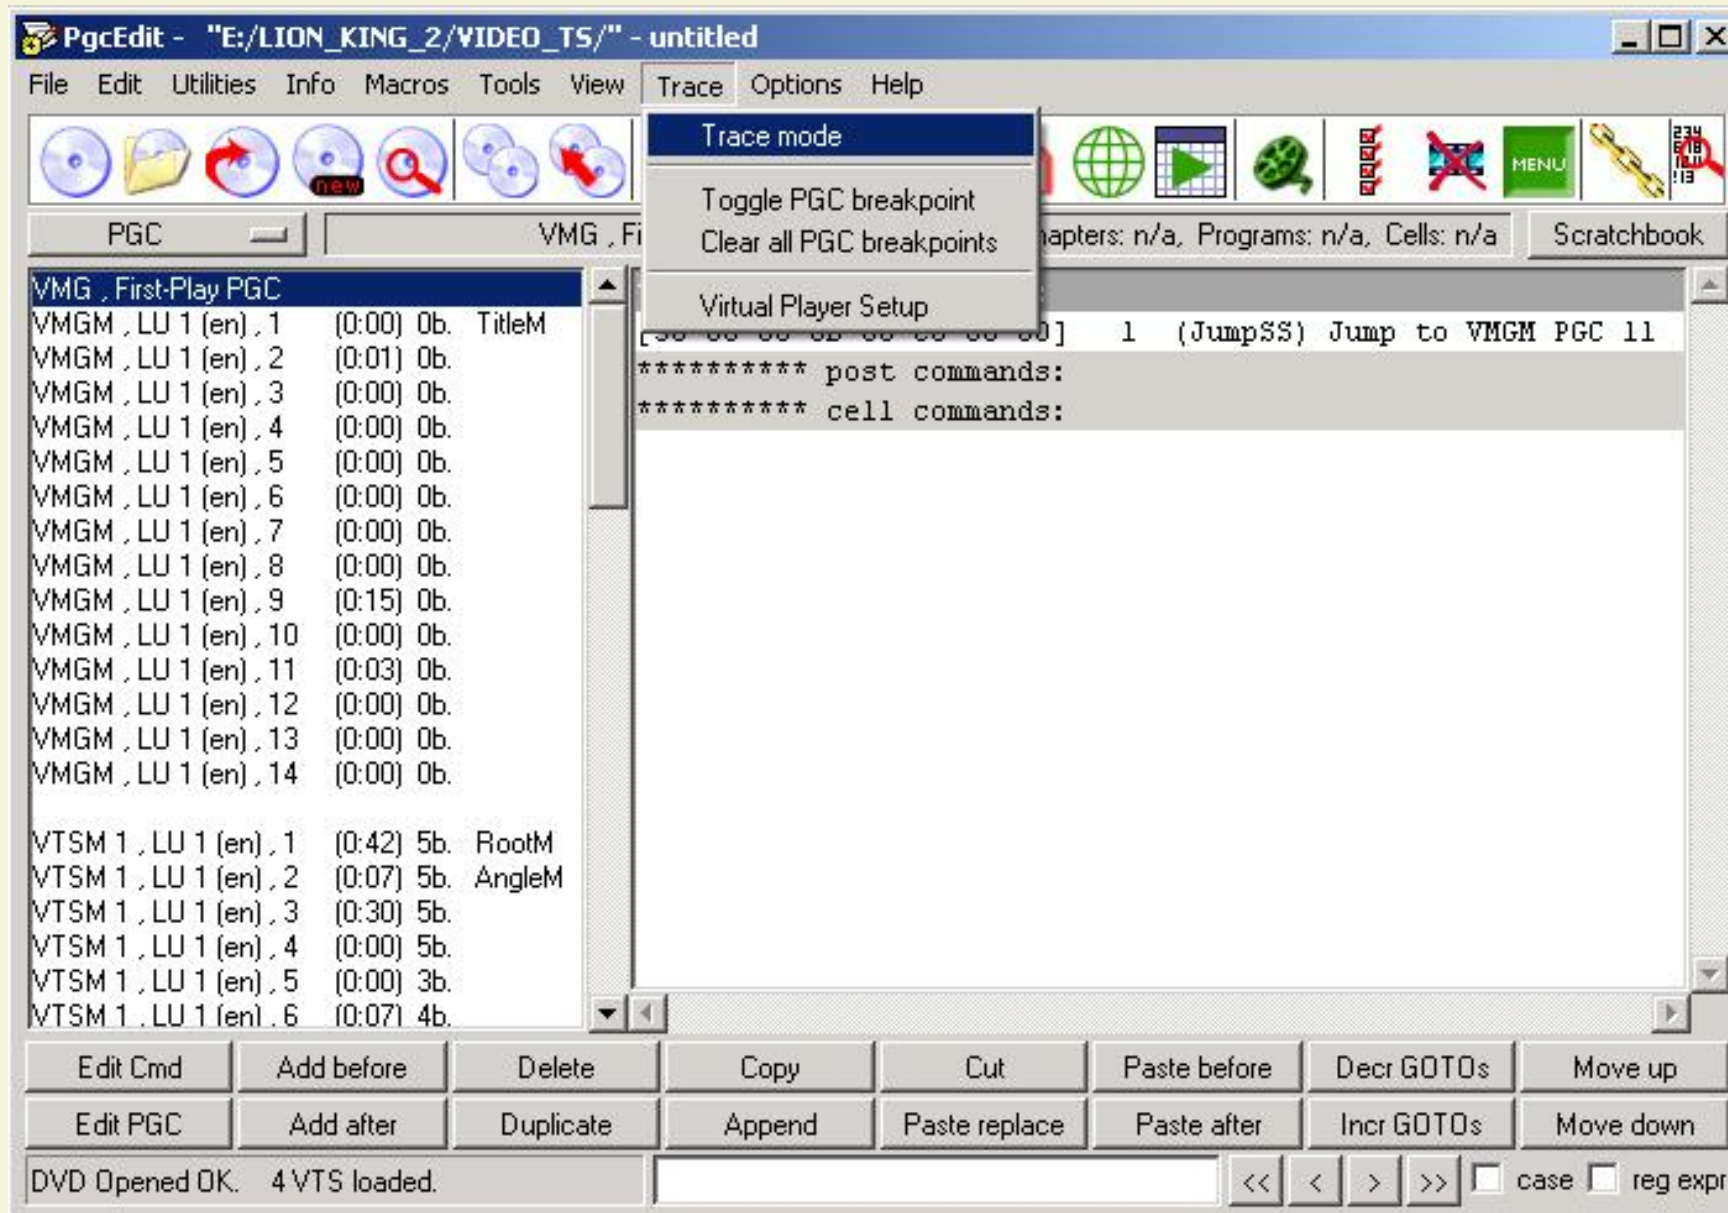

Note 1: In this guide, we just *skip* playback, but **we do not actually remove** the skipped material from the DVD. As a result, there is no gain in space.

Note 2: If you want to **bypass a menu** (for example a language menu), this guide is not for you! Check out 2COOL's [guide](#) for that, or my [guide](#) for jumping straight to the main menu or the movie.

Basic Idea: PgcEdit has a great function called "Trace". This allows you to step through the commands and the videos in your DVD pretty much the way a settop DVD player would, while watching everything that's going on (version 0.4.3.0 and above of PgcEdit also lets you preview the video!) If you're familiar with programming, this is the equivalent of putting a breakpoint at the start of your program, and single-stepping through each instruction, enabling/disabling breakpoints etc. We're going to use this function to play your DVD from the start, and "kill playback" on any program we don't want, until we hit the main menu. We can also kill playback on annoying stuff that comes after the main menu and before the movie!

Step 1: Open your DVD in PgcEdit

Simply click File/Open DVD, select your DVD folder, and click OK. Then enable the Trace Mode in the Trace menu.

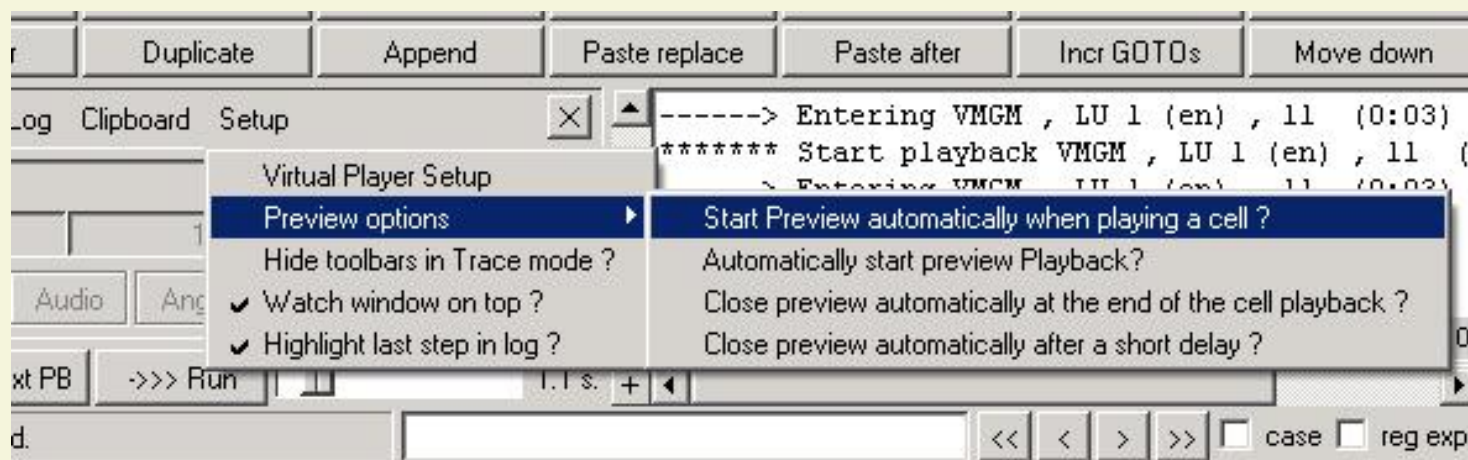

This will enable the Trace display at the bottom of the window.

More info:

If you're not familiar with PgcEdit, what you see on the left is the list of PGC (Program Chains), and on the right the pre, post and cell commands for the selected PGC. Click [HERE](#) if you need to learn about PGC, pre-commands, post-commands and cell commands.

Step 2: Start the trace!

- Click on the "up arrow" button , this will reset the "virtual" DVD player in PgcEdit. It is the equivalent of opening and closing the tray in a standalone player.
<> Setup your video-preview options. For the task at hand it's probably easier to do the preview ourselves. In the trace panel, click the Setup menu, and the Preview options submenu. Make sure nothing is selected.

"Start Preview automatically when playing a cell" means that if you run the trace and the virtual player encounters a PGC with video, it will automatically launch the previewer so you can see what's in there.

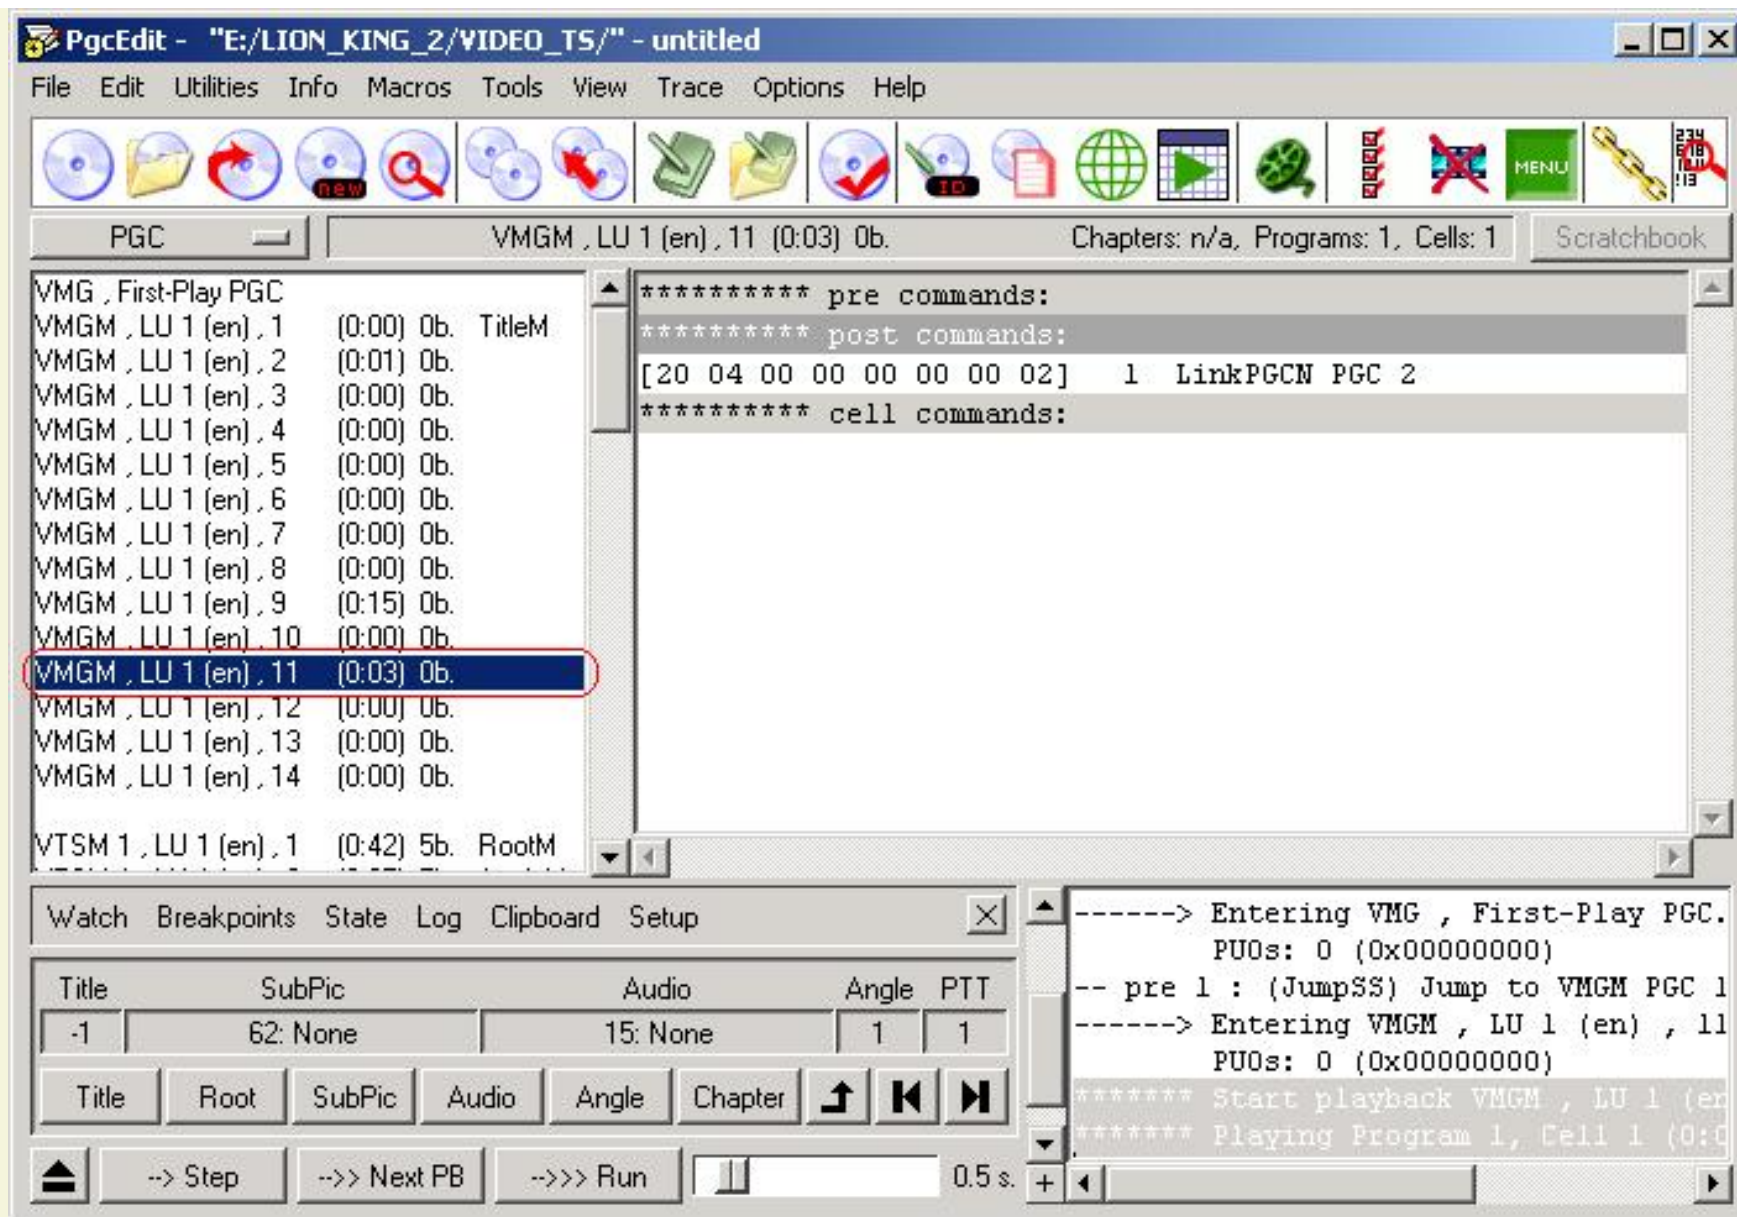

"Automatically start preview Playback" means that in addition, it will start the playback (as if you clicked on the "Play" button

of the previewer).

"Close preview automatically at the end of the cell playback" means that the previewer will be closed at the end of the playback.

"Close preview automatically after a short delay" means that the previewer will close after a delay selected by the slider. For now, it's probably simpler to do things by hand.

- Now click the "Next PB" (next playback) button . This will start the virtual player running (you will see the cursor highlight successive PGCs, jumping from place to place according to the PGC commands). These PGCs are PGCs with empty cells (video) associated with them.
- Soon the player will stop running, because it encountered a PGC with some video in it. The display will look something like this:

On the left, the current PGC is highlighted:

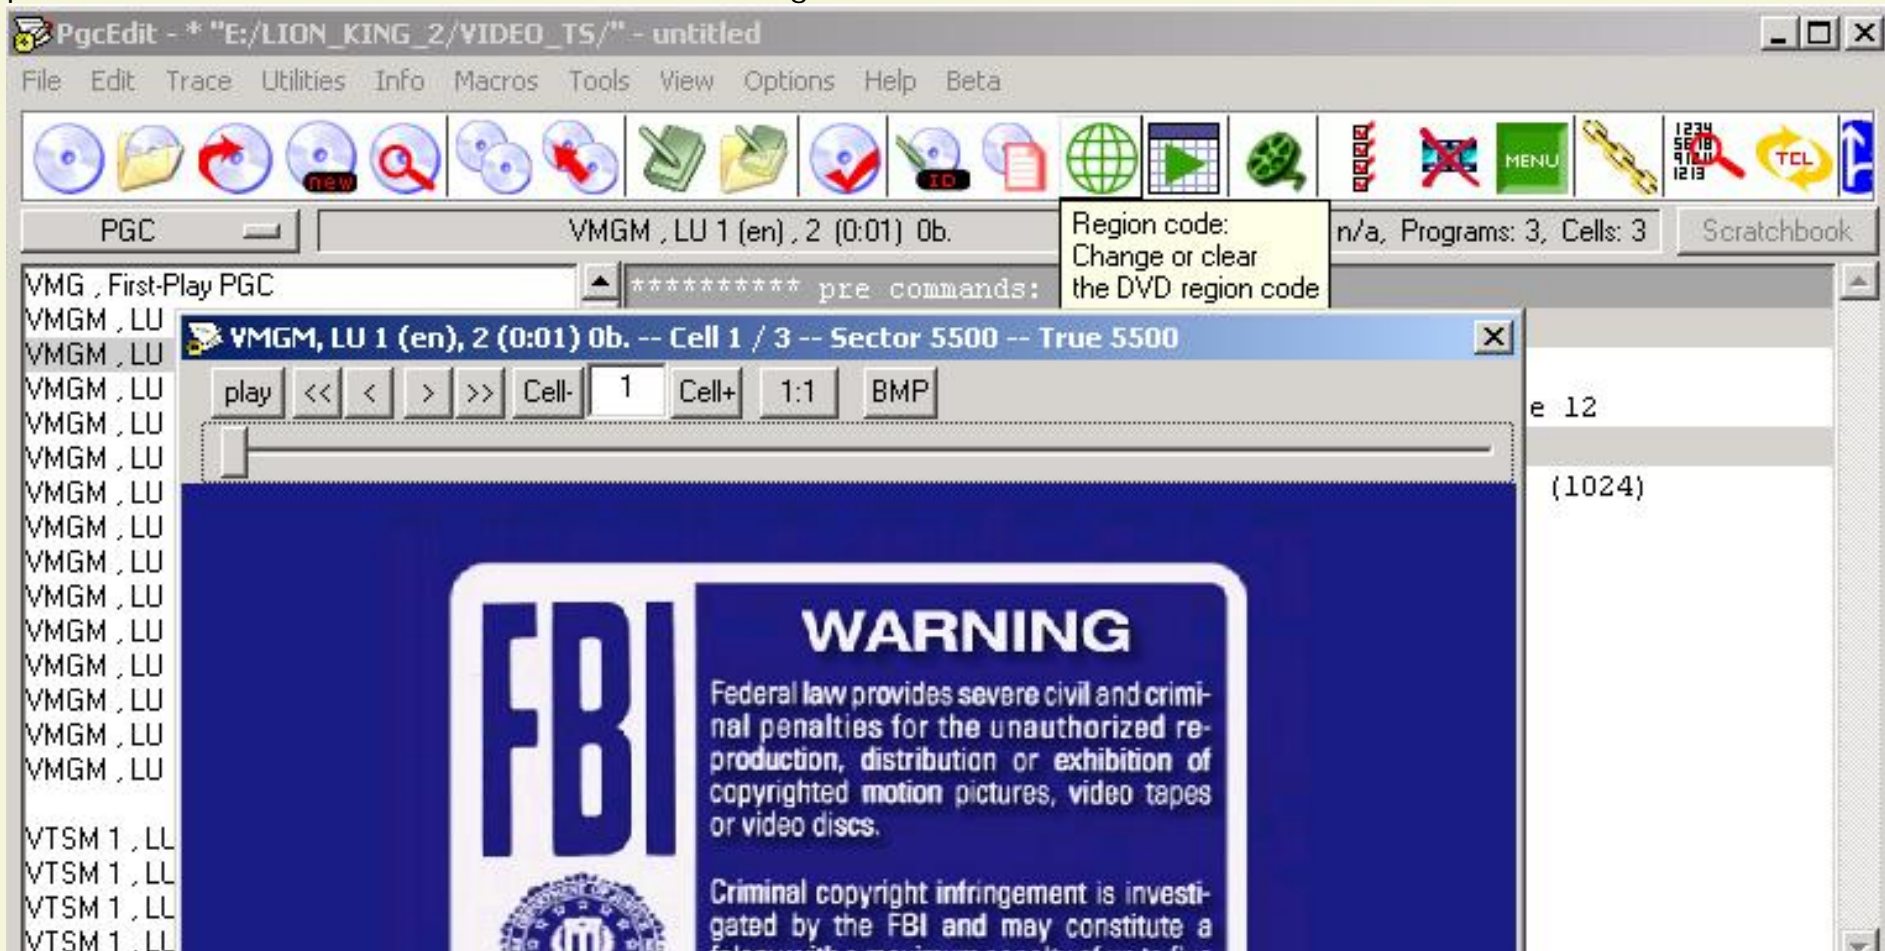

VMGM , LU 1 (en) , 11 (0:03) Ob.

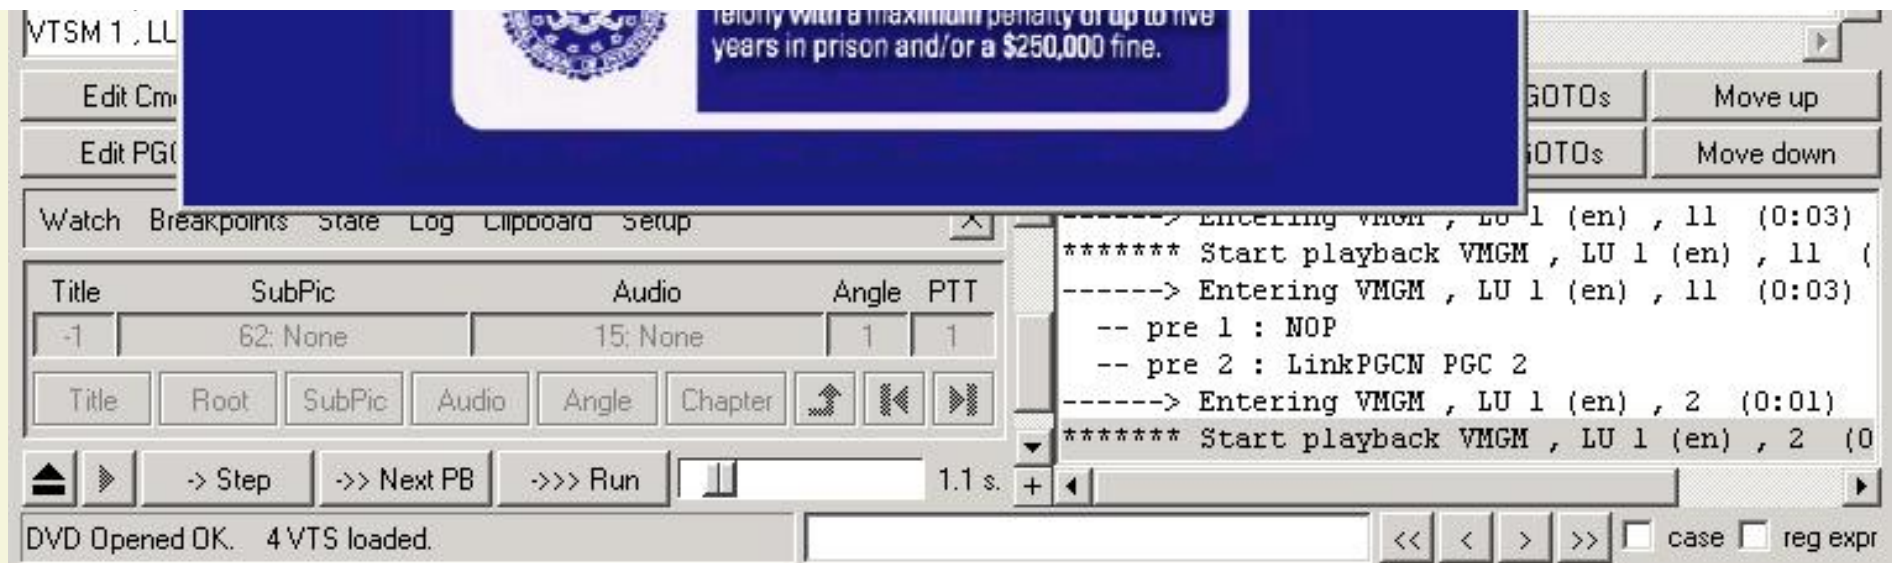

You can see that the video material **has no buttons (Ob.)**. This is important: the fact that the PGC's cell(s) has no button means we can skip the video without messing things up. **If the PGC indicates buttons, we can't kill it, we're done: go to Step 4 below.** Again, if you want to bypass a menu that has buttons, see the [note](#) above.

More info:

You can see that the program stopped at PGC 11 of the language unit 1 (LU 1), in the video manager (VMGM). You can also see that the video material played back is 3 seconds long (0:03), and has no buttons (0b.). If you want to know more about this PGC, you can right-click on it, and a window will popup with lots of info (how many cells, how many programs etc)

- Now you can preview what's in this video: hit the "V" key (the one right below you Esc key). This will launch the video previewer on the current PGC. You'll see something like this:

**More info:**

The preview window lets you see what's in the current PGC. You can use the slider to go anywhere in the PGC. The cell display will show you which cell you're currently in. You can use the arrows "<" and ">" to move 1 frame left or right, and the Cell+ and Cell- buttons to go from cell to cell. Additionally, you can hit the BMP button to save the current image as a bitmap file. That would be useful to extract an image from a DVD file, for example to create your own menu in an authoring tool.

In this case, the PGC contains 3 cells, one with a FBI warning, another with a warning and a black final one. We know that's one we can do without, so we can skip it!

Step 3: Skip the PGC!

- Now let's kill playback on that PGC! Simply click the "Kill Playback" button  in the tool bar. A message will popup:

This offers to not only bypass the playback of the cell(s) in the PGC, but also mark the PGC as having no cells/programs. Simply click No for now.

More info:

You'd click "yes" if you wanted to further process your files with IfoEdit to do a VOB ID strip: If the cells are no longer referenced, the ID for the cells will be automatically deselected in IfoEdit's GUI and you don't have to remember which VOB ID you need to strip.

The display will show:

The screenshot shows the PgcEdit interface. The main window displays a list of PGCs (Programs) and their associated commands. The selected PGC is VMGM, LU 1 (en), 11 (0:03) 0b. The command editor shows the following commands:

```

***** pre commands:
[00 00 00 00 00 00 00 00] 1 NOP
[20 04 00 00 00 00 00 02] 2 LinkPGCN PGC 2
***** post commands:
[20 04 00 00 00 00 00 02] 1 LinkPGCN PGC 2
***** cell commands:

```

The post-commands section is circled in red, indicating that the command [20 04 00 00 00 00 00 02] 1 LinkPGCN PGC 2 has been copied from the pre-commands section and pasted into the post-commands section.

The Watch Breakpoints State Log Clipboard Setup window is also visible, showing the current state of the PGC and its associated commands. The table below shows the current state of the PGC:

Title	SubPic	Audio	Angle	PTT
-1	62: None	15: None	1	1

The playback controls at the bottom show the current time is 0.5 s.

I've circled in red the area that changed. As you can see, the post-command has been copied and put at the bottom of the pre-commands.

More info:

Pre-commands get executed *before* the video in the PGC cell(s) is played back, while post-commands get executed *after* the video is played back. Post-commands normally jump (or *link*) to some other place in the DVD so playback can continue after the video has played. In the example above, the post-command "LinkPGCN" links to the second PGC in the same "domain" (here the VMGM, or video manager menu). So the normal sequence is

1) play the video in the PGC, then

2) jump to PGC #2

But "Kill Playback" copied the post-command as a pre-command, so the program links to PGC #2 *before* playing the video which has in effect been skipped! We can think 2COOL for this clever trick (and r0IZ for the corresponding macro in PgcEdit!). Things get a bit more complicated when certain pre-commands are present (such as break). You can read about such cases in 2COOL's [guide](#).

- Now we can hit the "Next PB" button  again, which will get us to the next non-empty PGC, and repeat **Step 3** above **if there are no buttons**, killing each PGC we encounter on the way!

Eventually, we'll get to a PGC that *does* have buttons, the first menu you'd see in a DVD player, unless the DVD was setup to play the movie right away.

We can proceed to **Step 4** below.

Step 4: We get to the main menu

In the example above, after killing 4 PGCs, I get to the following place:

The screenshot shows the PgcEdit application window. The title bar reads "PgcEdit - * 'E:/LION_KING_2/VIDEO_TS/' - untitled". The menu bar includes File, Edit, Utilities, Info, Macros, Tools, View, Trace, Options, and Help. The toolbar contains various icons for file operations and playback control. The main window is divided into a left pane showing a list of PGCs and a right pane showing the command list for the selected PGC.

The PGC list on the left includes:

- VMGM , LU 1 (en) , 8 (0:00) 0b.
- VMGM , LU 1 (en) , 9 (0:15) 0b.
- VMGM , LU 1 (en) , 10 (0:00) 0b.
- VMGM , LU 1 (en) , 11 (0:03) 0b.
- VMGM , LU 1 (en) , 12 (0:00) 0b.
- VMGM , LU 1 (en) , 13 (0:00) 0b.
- VMGM , LU 1 (en) , 14 (0:00) 0b.
- VTSM 1 , LU 1 (en) , 1 (0:42) 5b. RootM**
- VTSM 1 , LU 1 (en) , 2 (0:07) 5b. AngleM
- VTSM 1 , LU 1 (en) , 3 (0:30) 5b.
- VTSM 1 , LU 1 (en) , 4 (0:00) 5b.
- VTSM 1 , LU 1 (en) , 5 (0:00) 3b.
- VTSM 1 , LU 1 (en) , 6 (0:07) 4b.
- VTSM 1 , LU 1 (en) , 7 (0:00) 1b.
- VTSM 1 , LU 1 (en) , 8 (0:06) 0b.
- VTSM 1 , LU 1 (en) , 9 (0:07) 13b.

The command list for the selected PGC (VTSM 1 , LU 1 (en) , 1) is as follows:

```

***** pre commands:
[30 33 00 00 00 01 0D 00] 1 if ( gprm(13) != gprm(0) ) the
[30 36 00 0C 00 C0 0C 00] 2 if ( gprm(12) != gprm(0) ) the
[20 D4 00 05 00 0A 00 12] 3 if ( gprm(5) > 10 ) then { Lir
[20 B4 00 05 00 00 00 07] 4 if ( gprm(5) != 0 ) then { Lir
[20 A4 00 04 00 00 00 03] 5 if ( gprm(4) == 0 ) then { Lir
[71 00 00 04 00 00 00 00] 6 Set gprm(4) =(mov) 0
[56 00 00 00 04 00 00 00] 7 (SetHL_BTN) Set Highlighted Bu
***** post commands:
[30 06 00 0A 00 C0 00 00] 1 (JumpSS) Jump to VMGM PGC 10
***** cell commands:
[20 04 00 00 00 00 00 03] 1 LinkPGCN PGC 3

```

At the bottom, there is a "Watch Breakpoints State Log Clipboard Setup" window. The "Watch" tab is active, showing a table with columns: Title, SubPic, Audio, Angle, PTT.

Title	SubPic	Audio	Angle	PTT
2	62: None	15: None	1	1

Below the table are playback controls: Title, Root, SubPic, Audio, Angle, Chapter, and buttons for Step, Next PB, Run, and a 0.5 s timer.

The "Log" tab is also visible, showing the following log output:

```

Condition ( 1 == 0 ) : false.
-- pre 6 : Set gprm(4) =(mov) 0
-> gprm(4) = 0 (0x0000)
-- pre 7 : (SetHL_BTN) Set Highlighted
-> sprm(8:Highlighted button number) =
***** Start playback VTSM 1 , LU 1 (
***** Playing Program 1, Cell 1 (0:1

```

There are 5 buttons here so **I don't want to kill this PGC.**

More info:

As you can see, I'm in VTSM 1 (Video TitleSet Menu 1), Language Unit 1 (LU 1) PGC 1. You can also see that this is also the "Root Menu", the menu you would go to if you pressed the menu button on your remote. It has 5 buttons, and you can also see that it's a "motion menu" because it has a duration of 42 seconds (a motion menu is an animated menu, as opposed to a still menu). By right clicking on the highlighted PGC, you would find out that it has 3 cells, with the middle one having the 5 buttons. The first cell probably has the "menu intro" (what you see before the buttons appear, and the third one has the "menu outro" (what you see after you press a button).

If you hit the preview key "`", you will launch the previewer, and you can hit Play or move the slider to see exactly what's in there.

The screenshot shows the PgcEdit software interface. The title bar reads "PgcEdit - *\"E:/LION_KING_2/VIDEO_TS/\" - untitled". The menu bar includes File, Edit, Trace, Utilities, Info, Macros, Tools, View, Options, Help, and Beta. The toolbar contains various icons for file operations and playback. The status bar shows "PGC VTSM 1, LU 1 (en), 1 (0:42) 5b. RootM Chapters: n/a, Programs: 3, Cells: 3 Scratchbook".

The main window displays a list of VMGM, LU entries on the left. A preview window is open, showing a menu for "THE LION KING 2 SIMBA'S PRIDE". The menu has a dark background with a sunset scene and three buttons: "PLAY", "SCENE SELECTION", and "BONUS FEATURES". The preview window has a control bar with "Play", navigation arrows, "Cell- 2 Cell+", "1:1", and "BMP" buttons. A slider is visible below the control bar.

On the right side of the preview window, there is a list of commands and settings, including:

```

(0) ) then { (Jump
(0) ) then { (Jump
hen { LinkPGCN PGC
hen { LinkPGCN PGC
hen { LinkPGCN PGC
ighted Button = (mc
PGC 10
    
```

Here, I get to the main menu, with a first cell that's a short buttonless animated "intro" to the menu, a second cell with the menu buttons, and a third black cell. At this point, I know I need to keep this menu! (If you want to get rid of that menu, or more precisely, have the DVD jump straight to the movie instead of going through that menu, then check out [this guide](#)). Well, we're pretty much done!

Step 5: Save the DVD, and try it!

Click on the save icon and open the DVD in a software player. The player should skip all the material we "removed", and quickly go to the menu (it might not be instantaneous, you might see a quick sequence of title numbers flash by in the status area of the player, but it will take far less than a second).

A few notes:

- If you screw up, don't panic! Simply click the "restore backup" icon  and click OK when prompted. This will restore the original DVD and you can try again!
- If there's another menu before the main menu (for example, a language menu or an aspect-ratio menu), it will pop up at some point when you click on the Next PB button. *Don't kill playback* on the corresponding PGC because your DVD most likely no longer will play normally. Simply click on the menu button you would normally click on in the menu layout display and click OK. This will take you to the next video (or the main menu). You can also *skip that menu* but that's a bit involved. see the [note](#) above!

Optional Step 6: Going further: skipping the stuff *after* the menu.

Often times, when you press "Play" on the main menu to play the movie, you still have to watch more annoying stuff (the THX video, or more studio logos) before the movie actually starts. You can use the method above to skip these bits too! Here's how:

1. When you get to **Step 4** above and you get to the menu, you can hit the  button again, which will open the menu.

Menu buttons [X]

VTSM 1 / LU 1 / PGC 1, PG 2, Cell 2: VOB ID 1, Cell ID 2, 0:30.21

Group 1 (normal), 5 buttons, force select button 0, force action button 0

[20 04 00 00 00 00 08]
LinkPGCN PGC 8

Auto Action Copy to Clipboard []

Button 1 < >

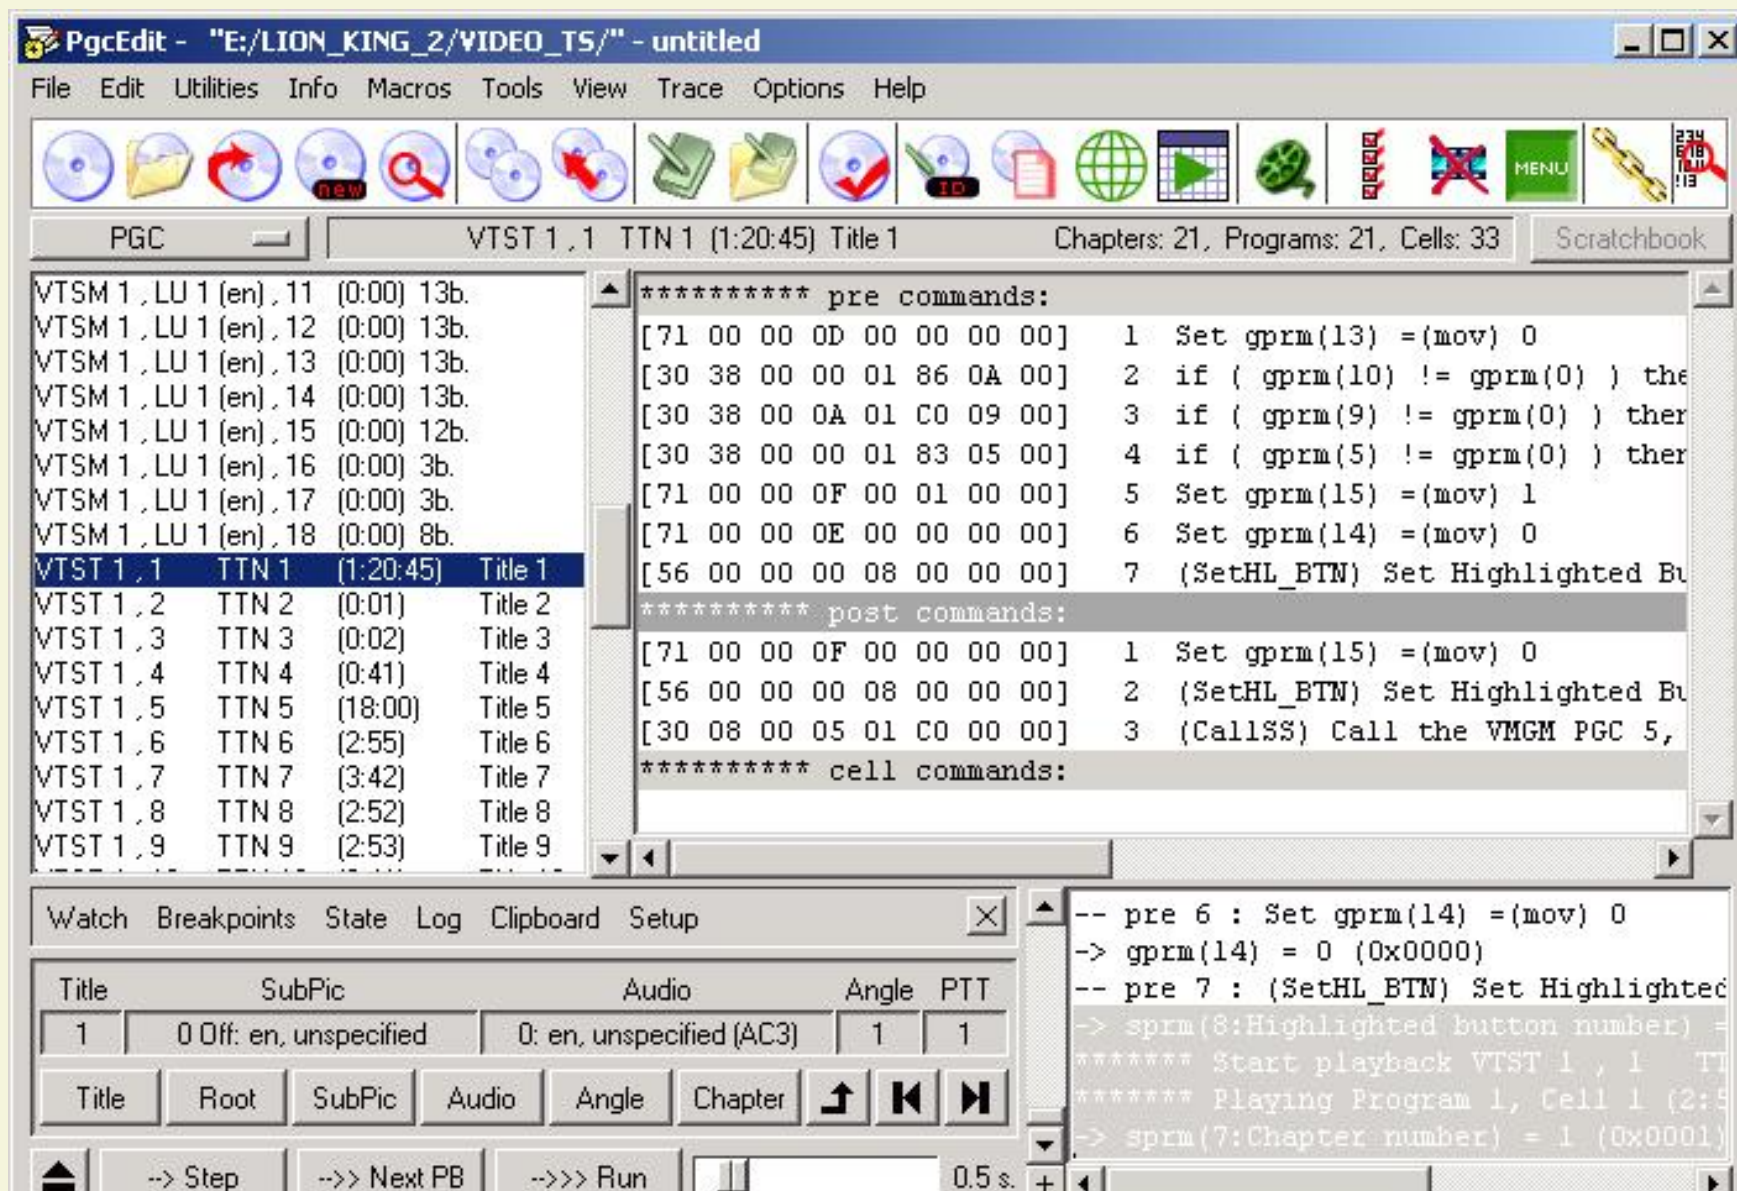

Preview Skip Select Select & Stop

Click on the button that corresponds to "Play Movie" and click Select. Playback will resume and stop at PGC of the next video

displayed.

- You can check what's in this next PGC using the previewer (the "" key). In my example, I get the THX clip, and another

studio logo before I get to the movie PGC. I can kill these two PGCs simply by clicking the  icon. The next one I encounter corresponds to Title 1:

The screenshot shows the PgcEdit application window. The main window title is "PgcEdit - 'E:/LION_KING_2/VIDEO_TS/' - untitled". The menu bar includes File, Edit, Utilities, Info, Macros, Tools, View, Trace, Options, and Help. The toolbar contains various icons for file operations, navigation, and editing. The main area is divided into a PGC list on the left and a command editor on the right. The PGC list shows several PGCs, with the selected one being "VTST 1,1 TTN 1 (1:20:45) Title 1". The command editor displays the following commands:

```

***** pre commands:
[71 00 00 0D 00 00 00 00] 1 Set gprm(13) =(mov) 0
[30 38 00 00 01 86 0A 00] 2 if ( gprm(10) != gprm(0) ) the
[30 38 00 0A 01 C0 09 00] 3 if ( gprm(9) != gprm(0) ) ther
[30 38 00 00 01 83 05 00] 4 if ( gprm(5) != gprm(0) ) ther
[71 00 00 0F 00 01 00 00] 5 Set gprm(15) =(mov) 1
[71 00 00 0E 00 00 00 00] 6 Set gprm(14) =(mov) 0
[56 00 00 00 08 00 00 00] 7 (SetHL_BTN) Set Highlighted Bu
***** post commands:
[71 00 00 0F 00 00 00 00] 1 Set gprm(15) =(mov) 0
[56 00 00 00 08 00 00 00] 2 (SetHL_BTN) Set Highlighted Bu
[30 08 00 05 01 C0 00 00] 3 (CallSS) Call the VMGM PGC 5,
***** cell commands:

```

At the bottom, there is a "Watch Breakpoints State Log Clipboard Setup" window. It contains a table with columns for Title, SubPic, Audio, Angle, and PTT. The table shows the following data:

Title	SubPic	Audio	Angle	PTT
1	0 Off: en, unspecified	0: en, unspecified (AC3)	1	1

Below the table are buttons for Title, Root, SubPic, Audio, Angle, Chapter, and playback controls (Step, Next PB, Run). The playback speed is set to 0.5 s.

The duration of the PGC shows 1:20:45, one hour and 20 minutes. Previewing the PGC confirms that this is indeed the movie, so we can stop right here. Save, and test in a software player. You will see that you'll skip the annoying stuff *before* and *after* the main menu! When you click "Play" on the main menu, the movie will start right away.

If you're having problems with this guide, post [here](#) and you'll get some help!
